Team Charter: Carolina Conway, Kassie Karnow, Carly Rauh, Luca Gerardi

1. Team Purpose/Mission:
   Our research question is: How are the approved FEMA disaster relief claims distributed across counties in NC impacted by Hurricane Helene? How does this correspond to the SVI map of socially vulnerable areas? If time allows, we hope to expand these questions to explore other hurricanes and their regions of impact. Our intended audience is county and state-level offices coordinating disaster relief, so that our data may inform their decisions about target areas for resources and support following natural disasters. Everyone in our group is interested in natural disaster relief and environmental justice, so this is an appropriate topic.

2. Communication Plan and Collaborative Coding:
   We will use an iMessage group to communicate and agree to respond to messages within 1 day. On the Monday before assignments are due, we will shorten our response time to 4 hours. We will use a shared Box folder for compiling data. We will work together each Thursday during our assigned class time, work independently throughout the weekend, and then meet every Monday at 11:30 in Grainger Hall to solidify our plan. We will make a plan with a clear to-do list on Thursday end of class so that we are on the same page heading into the weekend.

3. Roles and Responsibilities:
   All of us are excited to get more comfortable applying R to a real-world example that we could reproduce in a future career, especially related to oceans, watersheds, and climate change. We are also interested in learning mapping skills. As tasks arise, we will communicate clearly with each other on Thursday at the end of class to divide the workload equally and make sure that we are rotating through different types of work so that nobody is stuck doing the same thing over and over.

4. Operating Norms or Ground Rules:
   We will assign tasks on Thursday, finish those tasks by our Monday meeting, review what each other have done at our Monday morning, and be ready to submit by Tuesday. We will text whenever we are working to encourage accountability and avoid merge issues. We will do our best to estimate our worktimes on Thursday so that we can anticipate when each other will be working to avoid merge conflicts. If any member is not able to complete their work by Monday at 11:30, they are expected to text the group and communicate their plan for getting their work done. If

the Monday time does not work on a certain week, we will use the iMessage to come up with a new time.

5. Values and Behaviors:
   We want to prioritize having open communication, honesty about setting realistic time commitments, and supporting each other while we all have different workloads for other classes week-to-week. If someone has concerns about another person's work we should voice those concerns at the Monday meeting and discuss how we can support a higher quality of work. We value face-to-face direct communication.

6. We plan to utilize the TAs and course instructors when we cannot troubleshoot issues ourselves. We will use the class Slack as a resource. We are constrained by time, so we may not be able to answer our question fully across multiple hurricanes or timelines. We may only be able to focus on one disaster, which does not necessarily provide the most comprehensive data. If we run into issues that require follow-up questions about our data, we will reach out to TAs and instructors for help, and we will be flexible and willing to change our scope to better match our data.

7. We will make decisions about research questions based on what data is available, and we will agree to be flexible and open to each other's ideas if the course of our project changes. We will discuss decisions when we are all together in class in Thursday and at our Monday meetings. We do not anticipate having conflict that we cannot resolve within our project group.

8. A successful project is indicated by a strong foundation, demonstrated by our team charter and research questions, and our early milestone assignments.

   Essential deliverables:

   - Graphs and figures clearly comparing the FEMA data with the SVI data
   - Presentation of our key findings and directions for further research

   Optional features:

   - Expand spatial and temporal scope

9. We will determine the main person responsible for each milestone at our weekly class meetings, once we have a better idea of each member's time commitments. We understand that things come up week to week that we cannot anticipate now, so we want to be flexible with our schedule. We understand that this will require clear

and consistent communication. We expect to follow the milestone schedule that aligns with weekly assignments.
